a.

16. Apply a fix

```

function checkWeightAndHappinessBeforeUpdating() {
  // Add conditional so if weight is lower than zero.
  if (pet_info.weight < 0) {
    pet_info.weight = 0;
  }
  // Add conditional so if happiness is lower than zero. cmd i
  if (pet_info.happiness < 0) {
    pet_info.happiness = 0;
  }
  if (pet_info.energy < 0) {
    pet_info.energy = 0;
  }
}

```

- a.
- b. The bug was that pet_info.energy, pet_info.weight, and pet_info.happiness could go below zero after click Exercise repeatedly. The fix was adding three if checks inside checkWeightAndHappinessBeforeUpdating() that reset each value to 0 if it drops below zero. Preventing negatives stats from displaying on the page
